Understanding Variables and Typecasting

Presenter: Muhammad Bilal

Made with GAMMA

What Are Variables?

A variable is a container that stores data. It can hold different values throughout your program.

Example

A bottle stores water, just like a variable stores data.

Code Example

```
weight = 50
name = "Ali"
```

Made with GAMMA

Typecasting Explained

Typecasting means converting one data type into another.

Daily Life Example

Converting money from dollars to rupees.

Code Example

```
x = "10"
y = int(x)
```

The Mars Weight Problem

01

Understand the Formula

Weight on Mars = 37.8% of Earth weight

02

Get User Input

Take input from the user as a string

03

Typecast

Convert the input from string to float

04

Calculate

Calculate Mars weight using the formula

Made with GAMMA
