

1. What is your current occupation?

Computer Science student

2. Tell us a little about yourself

I am a Computer Science student who genuinely loves coding, AI, mathematics, and problem solving.

I enjoy learning new things and understanding how technology works in the real world.

Outside academics, I love playing football and have participated in national-level tournaments.

I also enjoy walking and going to the gym daily, where I train for around 1.5 hours.

I like listening to podcasts, especially when they help me learn something new or improve myself.

I believe these activities keep me disciplined, curious, and continuously improving.

3. What probability experience do you have?

My probability experience mainly comes from my BS Computer Science studies, where I have studied probability and related statistical concepts. I have worked with concepts such as random variables, probability distributions, conditional probability, independence, expectation, and variance.

I am also interested in Probability for AI because probability provides an important foundation for understanding how AI and Machine Learning models work with uncertainty and data. I have been exploring how concepts such as likelihood, variance, and probability are connected to machine learning methods.

I enjoy understanding the intuition behind mathematical concepts rather than only memorizing formulas.

4. What teaching experience do you have?

During my bachelor's, I have gained teaching experience through presentations, webinars, and workshops. I have explained mathematical and probability-related concepts using simple examples and practical scenarios. During teaching, I focus on building intuition first and then connecting concepts with formulas and problem solving. These sessions have helped participants understand difficult concepts more clearly and improve their confidence.

I have also learned how to communicate complex ideas in a simple, structured, and engaging way. Overall, This teaching experience has strengthened my ability to explain concepts and respond to questions effectively.
