Problem Statement

- An earthling's weight on Mars is 37.8% of their weight on earth.
- Write a Python program that prompts the user (an earthling) to enter their weight on earth
- and prints their calculated weight on Mars.

```
MARS_MULTIPLE = 0.378
```

Variables

- declare first
- have data type
- have a name
- contain some data

name	‘bilal’
age	20
height	6.5
is_student	True

Real Life Example
